Course #282 Baghouses

Baghouses and other types of fabric filters are used extensively for control of fine particulate matter. This course will review fundamental design and operating characteristics of baghouses, outline major operational and maintenance concerns, review relevant regulations and permit conditions, and discuss inspection procedures in detail. Air quality inspectors, site operators, and environmental professionals will find this information valuable in conducting inspections, minimizing emissions, and staying in compliance with air quality regulation.

Students will participate in a "mock inspection" at a local facility and complete a course exam to obtain a certificate of completion. **Hard Hat, Safety Shoes, Eye & Ear Protection are required.**

March 26, 2008

8:30 am - 4:30 pm

South Coast Air Quality

Management District

21865 East Copley Drive

Diamond Bar, California
